

Floods, Facts and Wetlands

How Spongelandscapes help
to tackle the Climate Crisis

PART 1 OF THE SPONGEBOOST COMIC SERIES

Hours later

The rain doesn't drain away at all, the lawn is completely under water! I've never experienced a downpour like this before ...

Oh rubbish, we've always had rain like this, haven't we?

Shortly afterwards ...

Oh dear, now the water is in the living room! Why don't you do something!

I don't know what to do! Nobody could have seen this coming!

clears throat

Well, let's be honest ... you humans have been working on this mess for quite a while ...

surf

Huh? Who are you?

And what do you mean? Are you saying it's all our own fault?

I'm Spongy – a specialist in rescue operations and honest words. Your anchor in stormy times, so to speak. I'm here to help you.

Of course, you two are not personally responsible for the drought and the torrential rain here, but there is no doubt that people influence the climate.

CLIMATE CRISIS

Since the beginning of industrialisation, the global temperature has risen significantly.³

As a result, **heavy rainfall**, for example, has become more frequent and stronger. And on the other hand, **droughts** and **extreme heat** are becoming more frequent.

Heat waves, droughts, floods, increased mortality, changes in ecosystems, water scarcity, sea level rise, ...^{3,4}

Take your pick from the cabinet of horrors!

Water crisis keeps Europe in suspense
We are not prepared⁹

Drought in Portugal
Forests are burning again¹⁰

Flooding in Germany
Politician says 'Nobody could have seen this coming!'¹¹

And look! The first World Climate Conference was held back in 1979. You've known for so long that the world is burning!

Yet somehow you've been wondering the whole time instead of drawing conclusions.

'Nobody could have seen this coming!'

Pff!

And there's more!

Here, for example, the Living Planet Index shows the decline in vertebrate populations since 1970.

SPECIES CRISIS

The climate crisis, and above all human lifestyles, are directly changing the habitats of plants and animals, thus accelerating the global extinction of species.^{3,4,5,6}

One of the causes: The destruction of species-rich ecosystems. For example, the draining of species-rich floodplains and river straightening since industrialisation

Dykes were intended to prevent fields and settlements from being flooded. What once were species-rich and diverse floodplain areas are now used to build settlements or for agriculture^{1,2}.

Straightened and deepened rivers enabled the use of heavy transport ships. Gravel and shallow banks were lost as habitats and the groundwater level sank.

It's no wonder that this can't go well in the long run ...

WATER STORAGE

Healthy soils can absorb water. This means that excess water is stored and remains available even during dry periods.

NH_4

NO_3

PO_4

STORAGE OF SUBSTANCES

Substances such as nitrogen, nitrate or phosphate can be absorbed and remain in the soil instead of being carried into the river.

DECELERATED WATER RUNOFF

Structurally rich vegetation slows down water runoff and improves infiltration. Peatlands, ponds and wetlands not only help natural water retention, but also biodiversity.

There are good strategies in the fight against the climate and species crisis.

These include nature-based solutions such as the **sponge landscape**.

When sponge landscapes are in good condition, they can absorb a lot of water and slowly release it back into their environment – a bit like a kitchen sponge.

There are various ways to restore our landscapes and turn them into natural sponges.

COOLING EFFECT

Green-blue infrastructure, i.e. biotopes that connect the landscape and are characterised by vegetation and water, cool the entire environment.

FREE-FLOWING RIVERS

If a river has room to meander, its natural dynamics create a unique mosaic of habitats. Water can spread into the surrounding sediments and supports groundwater recharge – this is where the sponge effect is particularly evident.

LET WATER INTO THE LANDSCAPE!

Relocate dikes, slit dikes,
remove bank reinforcements,
outlet structures for flooding
floodplains

KEEP WATER IN THE LANDSCAPE!

Slow down water runoff,
reconnect oxbow lakes,
reroute existing rivers
to slow them down and
wet drier floodplain areas

STOP DRAINAGE!

Close drainage ditches,
remove drains

The specific measures always depend
on the local situation.

In order to define suitable measures, we
need to bring together various groups such
as farmers, residents and policymakers.

Whew, that sounds better, but still a lot of work.

Then let's get to work, the storm is over.

But where should we start? Spongy, do you have an idea?

I can help you with that, but I need to speak with a few important people first.

Can you help me book a train ticket to Brussels?

If we get started together now, we can still make a difference.

Out of the state of shock and into action!

WE ARE THE SPONGEBOOST PROJECT

Europe's landscapes have faced extreme weather, from heatwaves and droughts to heavy rains, severely damaging ecosystems and society. To combat these challenges, the SpongeBoost project was launched. It brings together a team of 10 partners from 7 European countries, spanning research, policy, and management fields. SpongeBoost focuses on enhancing landscapes' natural sponge-like characteristics to manage water flow and storage. This involves refining existing methods, implementing them on a larger scale, and exploring innovative solutions. The project aims to strengthen landscapes' resilience against climate-related extremes through natural water retention.

ACKNOWLEDGEMENT

We would like to thank all SpongeBoost
partners for their feedback and commitment
to the translation. Special thanks go to our
project management at the UFZ for their advice
in all scientific matters.

**Funded by
the European Union**

SpongeBoost receives funding from the European Union's Horizon Europe research and innovation programme under grant agreement No.101112906.

Views and opinions expressed are those of the author(s) only and do not necessarily reflect those of the European Union or the European Climate, Infrastructure and Environment Executive Agency (CINEA). Neither the EU nor CINEA can be held responsible for them.
